CF: Compulsory Foundation, **C:** Core, **DE:** Discipline Elective, **IDC:** Inter-Disciplinary Elective, **SE:** Skill-based Elective, **VAC:** Value Added Courses
L: Lecture, **T:** Tutorial, **P:** Practical

Learning Outcomes of the Programme: After a successful completion of the Master programme in Physical Sciences i.e. M.Sc. Physics, students will be able to demonstrate the knowledge, general competence, and analytical skills on an advanced level, needed in industry, consultancy, education, research, or public administration. Students will have substantial knowledge in various areas of Physics, basic knowledge in Mathematics, and knowledge in supported fields like Computer Science. The work with the Master thesis will give special expertise within one of the research areas represented at the Department of Physical Sciences. Students will also have the background and experience to successfully carry out advanced tasks and projects, both independently and in collaboration with others. Along with this, students will also understand the role of physics in society and the background to consider ethical problems.

SEMESTER-I

Course Code: PHY.506

Course Title: Mathematical Physics

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: The course on Mathematical Physics is introduced to familiarize the students with the idea about transformation of coordinates and complex functions, special functions, group theory, and tensors which will be useful in understanding theoretical treatment and for developing a strong background to pursue research in theoretical physics.

Unit-I

15 hours

Vector Calculus, Matrices & Tensors: Vector calculus: properties of Gradient, divergence and Curl, matrix algebra, Caley-Hamilton theorem, Eigen values and Eigen vectors, curvilinear coordinates.(spherical and cylindrical coordinates) Tensors, Symmetric and antisymmetric, kronecker and Levi Civita tensors.

Elements of group theory: Group postulates, Lie group and generators, representation, Commutation relations, SU(2), O(3).

Unit-II

15 hours

Delta, Gamma, and Beta Functions: Dirac delta function, Properties of delta function, Gamma function, Properties of Gamma and Beta functions.

Special Functions: Legendre, Bessel, Hermite and Laguerre functions, recurrence relations, Orthogonality and special properties. Associated Legendre functions: recurrence relations, Parity and orthogonality, functions, Green's function.

Unit-III

15 hours

Complex Variable: Elements of complex analysis, Analytical functions, Cauchy-Riemann equations, Cauchy theorem, Properties of analytical functions, Contours in complex plane, Integration in complex plane, Deformation of contours, Cauchy integral representation, Taylor and Laurent series, Isolated and essential singular points, Poles, Residues and evaluation of integrals, Cauchy residue theorem and applications of the residue theorem.

Unit-IV

15 hours

Fourier and Laplace Transforms: Fourier series, Dirichlet condition, General properties of Fourier series, Fourier transforms, Their properties and applications, Laplace transforms, Properties of Laplace transform, Inverse Laplace transform and application.

Differential Equations Solutions of Hermite, Legendre, Bessel and Laguerre Differential equations, basics properties of their polynomials, and associated Legendre polynomials, Partial differential equations (Laplace, wave and heat equation in two and three dimensions), Boundary value problems and Euler equation.

Transaction Mode:

Lecture, demonstration, tutorial, problem solving,

Suggested Readings:

1. G. Arfken, H. Weber and F. Harris, *Mathematical Methods for Physicists* (Elsevier Academic Press, Massachusetts, USA) 2012.
2. E. Kreyszig, *Advanced Engineering Mathematics* (Wiley India Pvt. Ltd., New Delhi, India) 2011.
3. L. A. Pipes, *Applied Mathematics for Engineers and Physicist* (McGraw-Hill, Noida, India) 1985.
4. D. G. Zill, *Advanced Engineering Mathematics* (Jones & Barlett Learning, Massachusetts, USA) 2012.
5. P. K. Chattopadhyay, *Mathematical Physics* (New Age International (P) Ltd., New Delhi) 2000
6. *Mathematical Physics*, B.S. Rajput, Pragati Prakashan

Course Code: PHY.507**Course Title: Classical Mechanics****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: The overall goal of this course is to provide tools and applications of classical mechanics that student can use these in various branches of physics. Students who have completed this course have a deep understanding of solid understanding of classical mechanics (Newton's laws, Lagrangian mechanics, conservation principles, Hamiltonian formalism, Hamilton - Jacobi theory, central force, scattering, rigid body dynamics, small oscillations and special relativity). Establish firm physics and math foundation on which student can build a good carrier in physics.

Unit-I**16 hours**

Lagrangian Formalism: Newton's laws, Classification of constraints, D'lembert's principle and its applications, generalized coordinates, Lagrange's equation for conservative, non-conservative and dissipative systems and problems, Lagrangian for a charged particle moving in an electromagnetic field, Cyclic-coordinates, Symmetry, Conservations laws (Invariance and Noether's theorem).

Hamiltonian Formalism: Variational principle, Principle of least action, Hamilton's principle, Hamilton's equation of motion, Lagrange and Hamilton equations of motion from Hamilton's principle, Hamilton's principle to non-conservative and non-holonomic systems, Dynamical systems, Phase space dynamics and stability analysis.

Unit-II**14 hours**

Canonical Transformations and Hamilton - Jacobi theory: Canonical transformation and problems, Poisson brackets, Canonical equations in terms of Poisson bracket, Integral invariants of Poincare, Infinitesimal canonical

transformation and generators of symmetry, Relation between infinitesimal transformation and Poisson bracket, Hamilton–Jacobi equation for Hamilton’s principal function, Linear harmonic oscillator problem by Hamilton-Jacobi method, Action angle variables, Application to Kepler’s problem.

Unit-III

15 hours

Rigid Body Dynamics: Euler’s angles, Euler’s theorem, Moment of inertia tensor, Non- inertial frames and pseudo forces: Coriolis force, Foucault’s pendulum, Formal properties of the transformation matrix, Angular velocity and momentum, Equations of motion for a rigid body, Torque free motion of a rigid body - Poincot solutions, Motion of a symmetrical top under the action of gravity.

Two Body Problems: Central force motions, Reduction to the equivalent one-body problem, Differential equation for the orbit, Condition for closed orbits (Bertrand’s theorem), Virial theorem, Kepler’s laws and their derivations, Classification of orbits, Two body collisions, Scattering in laboratory and centre-of-mass frames.

Unit-IV

15 hours

Theory of Small Oscillations: Periodic motion, Types of equilibria, General formulation of the problem, Lagrange’s equations of motion for small oscillations, Normal modes, Applications to linear triatomic molecule, Double pendulum and N-Coupled oscillators.

Special Theory of Relativity: Lorentz transformations and its consequences, Relativistic kinematics and mass energy equivalence, Relativistic Lagrangian and Hamiltonian, Four vectors, Covariant formulation of Lagrangian and Hamiltonian.

Transaction Mode:

Lecture delivery using White Board and PPT, Problem Solving through Assignments.

Suggested Readings:

1. S.T. Thornton and J.B. Marion, *Classical Dynamics of Particles and Systems* (Cengage Learning, Boston/Massachusetts, United State), 5th edition, 2013.
2. J. Safko, H. Goldstein and C. P. Poole, *Classical Mechanics* (Pearson, New Delhi, India) 2011.
3. G. Walter, *Systems of Particles and Hamiltonian Dynamics* (Springer, New York, USA) 2010.
4. P.S. Joag and N.C. Rana, *Classical Mechanics* (Tata McGraw-Hill, Noida, India) 1991.
5. S.T. Thornton and J.B. Marion, *Classical Dynamics of Particles and Systems* (Cengage Learning, Boston/Massachusetts, United State), 5th edition, 2013.
6. J. Safko, H. Goldstein and C. P. Poole, *Classical Mechanics* (Pearson, New Delhi, India) 2011.

7. G. Walter, *Systems of Particles and Hamiltonian Dynamics* (Springer, New York, USA) 2010.
8. P.S. Joag and N.C. Rana, *Classical Mechanics* (Tata McGraw-Hill, Noida, India) 1991.

Course Code: PHY.508

Course Title: Quantum Mechanics

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: At the end of course, students will be able to apply mathematical formulation of quantum mechanics and Schrodinger's equation to solve eigen value problems such as box potential, harmonic oscillator, hydrogen atom and quantum mechanical tunneling. Students will also be able to apply: angular momentum algebra to find out C G coefficients; WKB method to describe bound states of potentials well and quantum scattering theory to calculate scattering amplitude.

Unit-I

14 hours

Mathematical Formulation and Postulates of Quantum Mechanics:

Limitations of Classical Mechanics and foundation of Quantum Mechanics, Review of linear vector spaces and related algebra and Hilbert space, Dirac notation, Operators: Hermitian, Unitary & Projection operators, Matrix representations of kets, bras and operators, Change of basis, Basic postulates of quantum mechanics, Schrödinger wave equation (time dependent and time independent), Expectation values, Commutation relations, Ehrenfest theorem. Generalized Heisenberg uncertainty principle, density matrix, Schrodinger, Heisenberg and Interaction pictures.

Unit-II

16 hours

Applications of Schrödinger Wave Equation: Solution of Harmonic oscillator using wave mechanics and matrix mechanics: matrix representation and eigen values of various operators, Anisotropic and isotropic harmonic oscillator, The box potential. **Hydrogen Atom:** Motion in central potential, Solution of Schrodinger equation for hydrogen atom. energy spectra of Hydrogen atom.

Angular Momentum: eigenvalues and eigen vectors of orbital angular momentum, Spherical harmonics, Angular momentum algebra and commutation relations, Matrix representation of angular momentum, Stern-Gerlach experiment, Spin angular momentum: Pauli matrices and their properties.

Unit-III

16 hours

Addition of Angular Momenta: Addition of two angular momenta, Transformation between bases: Clebsch-Gordan Coefficients, Eigenvalues of J^2 and J_z , Coupling of orbital and spin angular momenta. Wigner-Eckart Theorem (statement only)

WKB Method and its Applications: General formulation of WKB method, validity of WKB approximation, Bound states of potential wells with zero, one and two rigid walls, Application of WKB method to barrier penetration and cold emission of electrons from metals.

Unit-IV

14 hours

Scattering Theory: Quantum Scattering theory, Scattering cross-section and scattering amplitude, Born scattering formula, Central force problem, Partial wave analysis, Phase shifts, Optical theorem, Low energy s-wave and p-wave scatterings, Bound states and resonances, Breit-Wigner resonance formula (statement only), Green's functions in scattering theory, Born approximation and its validity, Scattering for different kinds of potentials, Scattering of identical particles.

Transaction Mode:

Lecture, demonstration, tutorial, problem solving.

Suggested Readings:

1. N. Zettili, *Quantum Mechanics-Concepts and Applications* (John Wiley & Sons Ltd., Sussex, U.K.) 2009.
2. E. Merzbacher, *Quantum Mechanics* (Wiley India Pvt. Ltd., New Delhi, India) 2011.
3. L.I. Schiff, *Quantum Mechanics* (Tata McGraw-Hill Education, Noida, India) 2010.

5. J. J. Sakurai, *Modern Quantum Mechanics* (Pearson Education, India) 2009.
6. D. J. Griffiths, *Introduction to Quantum Mechanics*, 2nd Ed. (Pearson Education, India) 2015.
7. G. D. Mahan, *Quantum Mechanics in a Nutshell* (Princeton University Press) 2009.
8. P.M. Mathews & K. Venkatesan, Tata-McGraw Pub. N. Delhi
9. V.K. Thankappan, *Quantum Mechanics*, New Age Pub. N. Delhi.

Course Code: PHY.509

Course Title: Electronics

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: The course on Electronics and Digital Electronics Circuits Theory is introduced to familiarize the students with the idea of electronic devices, circuits, operations, signal processing and their applications.

Unit-I**16 hours**

Transistor Amplifiers: Theory of semiconductors, Semiconductor devices: diode, homo and heterojunction devices, Transistor, Device structure and characteristics, Amplifiers, Frequency dependence and applications, Impedance matching, H and R parameters and their use in small signal amplifiers, Conversion formulae for the h-parameters of the different transistor configurations, Analysis of a transistor CE amplifier at low frequencies using h-parameters, CE amplifier with unbypassed emitter resistor, Emitter follower at low frequencies, Emitter-coupled differential amplifier and its characteristics, Cascaded amplifiers, Transistor biasing, Self-bias and thermal stability, filtering, Noise reduction, Low frequency power amplifiers, High frequency devices.

Unit-II**14 hours**

Optoelectronic Devices and Transducers: Solar cell, Photo detector and LEDs, Transducers, Measurement and control, Shielding and grounding.
Field Effect Transistor: Field effect transistor and its small signal model, CS and CD amplifiers at low frequencies, Biasing the FET, CS and CD amplifiers at high frequencies.

Unit-III**16 hours**

Feedback: The gain of an amplifier with feedback, General characteristics of negative feedback/instrumentation amplifiers, Stability of feedback amplifiers, Barkhausen criteria, Gain and phase margins, Compensation, Sinusoidal oscillators: RC oscillators: Phase shift and the Wien's bridge oscillators, LC oscillators, Frequency stability and the crystal oscillators, lockin detector , Box Car integrator and modulation techniques.
Operational Amplifier and Their Applications: Characteristics of an ideal operational amplifier, Amplification, Applications of operational amplifiers: Inverting and non-inverting amplifiers, Summing circuits, Integration and differentiation, Waveform generators signal conditioning and recovery.

Unit-IV**14 hours**

Combinational and Sequential Logic: Adders-sub tractors, Carry look ahead adder, BCD adder, Magnitude comparator, Multiplexer/DE-multiplexer, Encoder/decoder, Comparator Asynchronous/ripple counters, Synchronous counters, shift counters, Shift registers, Universal shift register.

Data Converters: Analog to digital (A/D) data converters, Digital to analog (D/A) data converters, Logic families, Microprocessors and micro controller basics.

Transaction Mode:

Lecture, demonstration, problem solving, PPT

Suggested Readings:

1. J. Millman, C. Halkias and C. Parikh, *Integrated Electronics: Analog and Digital Circuits and Systems* (Tata McGraw - Hill Education, Noida, India) 2009.
2. R.L. Boylestad and L. Nashelsky, *Electronic Devices and Circuit Theory* (Pearson, New Delhi, India) 2009.

7. C. Hawkins and J. Segura, *Introduction to Modern Digital Electronics* (Scitech Publishing, New York, USA) 2010.

Course Code: PHY.510

Course Title: Electronics Laboratory

Total Hours: 90

L	T	P	Cr
0	0	6	3

Learning Outcomes: The laboratory exercises have been so designed that the students can verify some of the concepts learnt in the electronics theory classes. During these laboratories they will get sufficient training to carrying out precise measurements and handling sensitive equipment.

Course Contents

Student has to perform any of eleven experiments from the following experiments.

- a) Power supplies: Bridge rectifiers with capacitive input filters.
- b) Power supplies: Shunt Voltage regulator using Zener diode.
- c) Clipping and Clamping along with CRO.
- d) Common Emitter Amplifier with and without feedback.
- e) Determination of h-parameters in the CE configuration using the measured input and output characteristics of a BJT.
- f) Common Source and Common Drain Amplifiers using JFET.
- g) RC Oscillators: Phase shift oscillator using RC ladder network as the phase shifting network.
- h) Wien's Bridge Oscillator.
- i) Colpitts Oscillators.
- j) Hartley Oscillators.
- k) Emitter Coupled Differential Amplifier using BJT's.
- l) Multivibrators – Bistable, Monostable and Free Running multivibrators
- m) Op-Amp characteristics: V_{io} , I_b , V_{ol} , CMRR, Slew Rate. Applications of Op-amps: inverting Amplifier, Unity Gain Buffer, Summing Amplifier.

- n) 555 IC timers. Free Running and Monostable Multivibrators, Sawtooth wave generator.
- o) Realization of universal logic gates.
- p) Implementation of the given Boolean function using logic gates in both SOP and POS form.
- q) Perform the logic state tables of RS and JK flip-flops using NAND & NOR gates.
- r) Perform the logic state tables of T and D flip-flops using NAND & NOR gates.
- s) Perform the Verification of logic state tables of master slave flip flop using NAND & NOR gates.
- t) Triggering mechanism of flip flop.
- u) Perform the Realization of Half adder and full adder.
- v) Perform the Half subtractor and full subtractor.
- w) Decoders and code converters.
- x) Up/Down Counters.
- y) Shift Register.

Transaction Mode:

demonstration, experimentation

Suggested Readings:

1. J. Millman, C. Halkias and C. Parikh, *Integrated Electronics: Analog and Digital Circuits and Systems* (Tata McGraw - Hill Education, Noida, India) 2009.
2. R.L. Boylestad & L. Nashelsky, *Electronic Devices and Circuit Theory* (Pearson, New Delhi) 2009.
3. B. L. Theraja, *Basic Electronics: Solid State* (S. Chand & Company Ltd., New Delhi) 2010.

7. C. Hawkins and J. Segura, *Introduction to Modern Digital Electronics* (Scitech Publishing, New York, USA) 2010.

Course Code: PHY.511

Course Title: Modern Physics Laboratory

Total Hours: 90

L	T	P	Cr
0	0	6	3

Learning Outcomes: At the end of this course, students will be able gain practical knowledge of various theoretical aspects of modern physics such as photoelectric effect, ionization potential of Ar, band gap of semiconductor, wavelength of laser etc.

Course Contents

Student has to perform at least seven experiments from the following list of experiments.

1. Ionization potential by Franck Hertz experiment.
2. Photo electric effect.
3. Band gap of a semiconductor by Four Probe method.
4. Wavelength measurement of laser using diffraction grating.
5. Michelson interferometer.
6. Fabry-Perot Interferometer
7. Dual nature of electron experiment.
8. Millikan's oil drop experiment.
9. Stefan's law
10. Zeeman effect experiment

Transaction Mode:

Demonstration, experimentation, group learning.

Suggested Readings:

1. R.A. Serway, C.J. Moses & C.A. Moyer, *Modern physics*, Brooks Cole, Massachusetts, USA 2012.
2. S.T. Thornton, *A. Rex Modern Physics for Scientists and Engineers* (Thomson Brooks/Cole, Massachusetts, USA) 2012.
3. K.S. Krane, *Modern Physics* (Wiley India (P) Ltd., New Delhi, India) 2012.
4. A. Beiser, *Concepts of Modern Physics* (Tata McGraw - Hill Education, Noida, India) 2007.

Course Code: PHY.512

Course Title: Physics in Everyday Life

Total Hours: 30

L	T	P	Cr
2	0	0	2

Learning Outcomes: Students will learn the important role of physics in the everyday life of human beings. This course will provide a better understanding of physics principles in earth's atmosphere, human body, sports, and technology. Students will be able to apply the physics principles in another discipline as a way to deepen the learning experience.

Unit-I

8 hours

Physics in Earth's Atmosphere: Sun, Earth's atmosphere as an ideal gas; Pressure, temperature and density, Pascal's Law and Archimedes' Principle, Coriolis acceleration and weather systems, Rayleigh scattering, the red sunset, Reflection, refraction and dispersion of light, Total internal reflection, Rainbow.

Unit-II**7 hours**

Physics in Human Body: The eyes as an optical instrument, Vision defects, Rayleigh criterion and resolving power, Sound waves and hearing, Sound intensity, Decibel scale, Energy budget and temperature control.

Unit-III**8 hours**

Physics in Sports: The sweet spot, Dynamics of rotating objects, Running, Jumping and pole vaulting, Motion of a spinning ball, Continuity and Bernoulli equations, Bending it like Beckham, Magnus force, Turbulence and drag.

Unit-IV**7 hours**

Physics in Technology: Microwave ovens, Lorentz force, Global Positioning System, CCDs, Lasers, Displays, Optical recording, CD, DVD Player, Tape records, Electric motors, Hybrid car, Telescope, Microscope, Projector etc.

Transaction Mode: Lecture, demonstration, PPT

Suggested Readings:

1. How Things Work THE PHYSICS OF EVERYDAY LIFE, Louis A. Bloomfield, Wiley, 2013.
2. Sears and Zemansky, *University Physics* (Addison Wesley, Boston, USA) 2007.
3. M. Nelkon and P. Parker, *Advanced Level Physics* (Heinemann International, London, U.K.) 2012.
4. B. Lal and Subramaniam, *Electricity and Magnetism* (Ratan Prakashan Mandir, Agra, India) 2013.
5. E. Hecht, *Optics* (Addison Wesley, Boston, USA) 2001.
6. H. C. Verma, *Concepts of Physics* (Bharati Bhawan publishers and distributors, New Delhi, India) 2011.

SEMESTER II**Course Code: PHY.521****Course Title: Numerical Methods****Total Hours: 30**

L	T	P	Cr
2	0	0	2

Learning Outcomes: The students of M.Sc. Physics will be equipped with knowledge of programming in C, roots of equation, interpolation, curve fitting, numerical differentiation, numerical integration, solution of ordinary differential equations and random numbers after completing the course on Numerical Methods.

Unit-I**8 hours**

Programming with C: Computer Algorithm, Data types, C programming syntax for Input/Output, Control statements: if, if-else and nested-if statements. Looping: while, for and do-while loops, Functions: Call by values

and by references, Arrays and structures: one dimensional and two-dimensional arrays, Pointers, Idea of string and structures. Preprocessors.

Unit-II

7 hours

Roots of Nonlinear Equations: Element of computational techniques: Error analysis, Propagation of errors. Roots of functions, Bracketing and open end methods: Bisection Method, False position method and Newton Raphson method.

Unit-III

8 hours

Interpolation and Least Square Fitting: Linear Interpolation, Lagrange and Newton Interpolation, Linear and non-linear curve fitting

Numerical Differentiation and Integration: Differentiation of continuous functions Integration by Trapezoidal and Simpson's rule.

Unit-IV

7 hours

Numerical Solution of Ordinary Differential Equations: Euler method and Runge-Kutta method.

Random Numbers: Introduction to random numbers, Monte Carlo method for random number generation, Chi square test.

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

1. Y. Kanetkar, *Let Us C* (BPB Publications, New Delhi, India) 2012.
2. Balaguruswamy, *Numerical Methods* (Tata McGraw Hill, Noida, India) 2009.
3. S. S. Sastry, *Introductory Methods of Numerical Analysis*, PHI Learning Pvt.Ltd., NewDelhi,2012.
4. R. C. Verma, P. K. Ahluwalia & K. C. Sharma, *Computational Physics*, New Age, 1st edition,1999.
5. Tao Pang, *an Introduction to Computational Physics* (Cambridge University Press) 2nd edition, 2006.

Course Code: PHY.522

Course Title: Numerical Methods Laboratory

Total Hours: 60

L	T	P	Cr
0	0	4	2

Learning Outcomes: The laboratory exercises have been so designed that the students will learn the usage of C language to solve a mathematical problem and various physics problems. Students will learn the use of computers for solving physics based problems.

Course Contents

Students have to perform at least five experiments from Part-A and five experiments from Part-B.

Part-A

1. To find the root of nonlinear equation using Bisection method.
2. To study the numerical convergence and error analysis of non-linear equation using Newton Raphson method.
3. To find the value of y for given value of x using Newton's interpolation method.
4. Perform numerical integration on 1-D function using Trapezoid rule.
5. Perform numerical integration on 1-D function using Simpson rules.
6. To find the solution of differential equation using Runge-Kutta method.
7. To find the solution of differential equation using Euler's method.
8. Choose a set of 10 values and find the least squared fitted curve.
9. To find eigenvalues and eigenvectors of a Matrix.

Part-B

1. Study the motion of spherical body falling in viscous medium using Euler method.
2. To study the path of projectile with and without air drag using Feynman-Newton method.
3. Study the motion of an artificial satellite around a planet.
4. Study the motion of one dimensional harmonic oscillator without and with damping effects.
5. To obtain the energy eigenvalues of a quantum oscillator using Runge-Kutta method.
6. Study the motion of charged particles in uniform electric field, uniform magnetic field and combined uniform EM field.
7. To study the phenomenon of nuclear radioactive decay.
8. To study the EM oscillation in a LCR circuit using Runge-Kutta method.

Transaction Mode:

demonstration, experimentation

Suggested Readings:

1. Y. Kanetkar, *Let Us C* (BPB Publications, New Delhi, India) 2012.
2. Balaguruswamy, *Numerical Methods* (Tata McGraw Hill, Noida, India) 2009.

4. R. C. Verma, P. K. Ahluwalia & K. C. Sharma, *Computational Physics*, New Age, 1st edition,1999.
5. Tao Pang, *An Introduction to Computational Physics* (Cambridge University Press) 2nd edition, 2006.

Course Code: PHY.523

Course Title: Quantum, Atomic and Molecular Physics

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: At the completion of course, students will be able to describe the importance of perturbation theory to explain Stark effect, Paschen Back effect, Anomalous Zeeman effect, fine structure of hydrogen atom, Fermi Golden rule and selection rules for absorption and emission of light. Also students will apply their knowledge of quantum mechanical concepts to describe atomic and molecular spectra in details.

Unit-I

14 hours

The Variational Method: Theory and its applications to ground state of harmonic oscillator and hydrogen atom, the ground state of helium and hydrogen molecule ion.

Time-independent Perturbation Theory: Non-degenerate (1st and 2nd order) and degenerate case, Application of perturbation theory: charged oscillator in an electric field, Stark effect, Paschen-Bach Effect and Zeeman effect in hydrogen atom, Width of spectrum lines.

Unit-II

16 hours

Time-dependent Perturbation Theory: Time development of states and transition probability, Adiabatic and sudden approximations, Fermi golden rule and its application to radiative transition in atoms, Spontaneous emission: Einstein's A and B coefficients, Selection rules for emission and absorption of light, Optical pumping and population inversion, rate equation, Modes of resonators and coherent length.

Relativistic Quantum Mechanics: Klein-Gordon equation, Dirac relativistic equation, Gamma Matrices, Significance of negative energy, Spin-orbit interaction, Relativistic correction, Fine structure of hydrogen atom.

Unit-III

16 hours

Identical Particles: Spin-Statistics connection, Pauli's exclusion principle, Slater determinant, Exchange energy: Parahelium and orthohelium, Independent particle model, Hartree-Fock equations, Elementary idea of density functional theory.

Atomic Spectra: Revision of quantum numbers, electron configuration, Hund's rule etc. origin of spectral lines, LS & JJ coupling, selection rules, Spectrum of hydrogen, helium and alkali atoms, X-ray spectra, fine spectra, hyperfine structure, Width of spectrum lines.

Unit-IV

14 hours

Molecular Spectra: Molecular potential, Separation of electronic and nuclear wave functions, Born-Oppenheimer approximation, Electronic, Vibrational and rotational spectrum of diatomic molecules, Selection rules, Frank-Condon principle, Raman transitions and Raman spectra, Normal vibrations of CO₂ and H₂O molecules.

Transaction Mode:

Lecture, tutorial, problem solving.

Suggested Readings:

1. K. Venkatesan, P.M. Mathews, *A Textbook of Quantum Mechanics* (Tata McGraw - Hill Education, Noida, India) 2010.
2. J.J Sakurai, *Advanced Quantum Mechanics* (Pearson, New Delhi, India) 2006.
3. J.J. Sakurai, J. Napolitano, *Modern Quantum Mechanics* (Pearson India, New Delhi,) 2014.
4. N. Zettili, *Quantum Mechanics: Concepts and Applications* (John Wiley & Sons Ltd., Sussex, U.K.) 2009.
5. J. Griffiths, *Introduction to Quantum Mechanics*, Second Edition (Pearson Education, India) 2015.
6. G. D. Mahan, *Quantum Mechanics in a Nutshell* (Princeton University Press) 2009.
7. V.K. Thankappan, *Quantum Mechanics*, New Age Pub. N. Delhi.
8. M.P. Khanna, *Quantum Mechanics*, Har Anand Pub. N. Delhi. (1999)
9. C.J. Foot, *Atomic Physics* (Oxford University Press, Oxford, U. K.) 2005.
10. *Fundamentals of Molecular Spectroscopy*, C. N. Banwell and E. M. McCash, (Tata, McGraw Hill Publishing Company Limited).

Course Code: PHY.524

Course Title: Electromagnetic Theory

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: At the end of the course, students will be able to explain various concepts of electrostatics and magnetostatics. Students will also solve the boundary value problems and will explain the propagation of electromagnetic waves in dielectrics, metals and plasma. This course will also inculcate the knowledge of the motion of relativistic and non-relativistic charged particles in electrostatic and magnetic fields.

Unit-I**16 hours**

Electrostatics: Gauss's law and its applications, Work and energy in electrostatics, Electrostatic potential energy, Poisson and Laplace equations, Uniqueness theorem I & II, Energy density and capacitance.

Boundary Value Problems: General methods for the solution of boundary value problems, Solutions of the Laplace equation, Various boundary value problems.

Multipoles and Dielectrics: Multipole expansion, Multipole expansion of the energy of a charge distribution in an external field, Dielectrics and conductors, Gauss's law in the presence of dielectric, Boundary value problems with dielectrics, , Electrostatic energy in dielectric media.

Unit-II**14 hours**

Magnetostatics: Biot-Savart law and Ampere's theorem, Electromagnetic induction, Vector potential and magnetic induction for a circular current loop, Magnetic fields of a localized current distribution, Boundary condition on B and H, Uniformly magnetized sphere.

Magnetic Fields in Matter: Magnetization, Dia, para and ferro-magnetic materials, Field of a magnetized object, Magnetic susceptibility and permeability.

Unit-III**16 hours**

Maxwell's Equations: Maxwell's equations in free space and linear isotropic media, Boundary conditions on the fields at interfaces.

Time Varying Fields and Conservation Laws: Scalar and vector potentials, Gauge invariance, Lorentz gauge and Coulomb gauge, Poynting theorem and conservations of energy and momentum for a system of charged particles, EM fields.

Plane Electromagnetic Waves and Wave Equations: EM wave in free space, Dispersion characteristics of dielectrics, Waves in a conducting and dissipative media, Reflection and refraction, Polarization, Fresnel's law, Skin effect, Transmission lines and wave guides, TE mode, TM mode, Cut off wavelength, Phase Velocity, Group velocity and Guide wave length.

Unit-IV**14 hours**

Radiation from Moving Point Charges and Dipoles: Retarded potentials, Lienard-Wiechert potentials, Radiation from a moving point charge and oscillating electric and magnetic dipoles, Dipole radiation, Multipole expansion for radiation fields. **Relativistic Electrodynamics:** Lorentz transformation law for the electromagnetic fields and the fields due to a point charge in uniform motion, Field invariants, Covariance of Lorentz force equation and dynamics of a charged particle in static and uniform electromagnetic fields.

Transaction Mode:

Lecture, Demonstration, Power point Presentations

Suggested Readings:

1. M.A. Heald and J.B. Marion, *Classical Electromagnetic Radiation* (Dover Publications, New York, USA) 2012.
2. D.J. Griffiths, *Introduction to Electrodynamics*, Prentice Hall of India Pvt.Ltd., New Delhi, 2012.
3. A. Zangwill, *Modern Electrodynamics* (Cambridge University Press, Cambridge, U.K.) 2012.
4. J.D. Jackson, *Classical Electrodynamics* (Wiley India (P) Ltd., New Delhi, India) 2004.
5. E.M. Lifshitz, L.D. Landau and L.P. Pitaevskii, *Electrodynamics of Continuous Media* (Elsevier, New York, USA) 1984.

Course Code: PHY.525
Course Title: Solid State Physics
Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: This physics course is to provide the student with a clear and logical presentation of the basic and advanced concepts and principles of solid state physics. Students who have completed this course have a deep understanding of topics like crystal structure, lattice vibrations, band theory of solids, magnetic properties of solids, defects, superconductivity so that they are able to use these techniques in investigating the aspects of the matter in condensed phase.

Unit-I **15 hours**

Crystal Structure and its determination: Bravais lattices, Crystal structures, Reciprocal lattices, Ewald sphere, X-ray diffraction, Lattice parameter determination, Atomic and crystal structure factors, Intensity of diffraction maxima, Electron and neutron diffraction, Bonding of solids., Ordered phases of matter: translational and orientational order, kinds of liquid crystalline order, Quasi crystals.

Lattice Dynamics: Elastic properties of solids, Vibrations of linear monatomic and diatomic lattices, Acoustical and optical modes, Long wavelength limits, Optical properties of ionic crystal in the infrared region, Normal modes and phonons, Inelastic scattering of neutron by phonon, Lattice heat capacity, models of Debye and Einstein, Comparison with electronic heat capacity, Thermal expansion, Thermal conductivity.

Unit-II **15 hours**

Free Electron and Band Theory of Solids: Free electron theory, Density of states, Boltzmann transport equation (Response and relaxation phenomena), Drude model of electrical and thermal conductivity and Sommerfeld theory, Hall effect and quantum Hall effect, Electrons motion in periodic potentials, Bloch theorem, Kronig Penny model, Nearly free electron theory, Band gap, Number of states in a band, Tight binding method, Effective mass of an electron in a band, Classification of metal, Semiconductor (Direct and Indirect) and insulator, Thermoelectric power.

Unit-III **15 hours**

Magnetic Properties of Solids: Classical and quantum theory of diamagnetism and paramagnetism, Pauli paramagnetism, Landau diamagnetism, Cooling by adiabatic demagnetization, Weiss theory of ferromagnetism, Curie-Weiss law, Heisenberg's model and molecular field theory, Domain structure and Bloch wall, Neel model of antiferromagnetism and ferrimagnetism, Spin waves, Bloch $T^{3/2}$ law, ESR, NMR and chemical shifts.

Unit-IV**15 hours**

Defects and Dislocations: Point defects (Concentration of Frenkel and Schottky), Line defects (slip, plastic deformation, Edge and Screw dislocation, Burger's vector, Concentration of line defects, Estimation of dislocation density, Mechanism of Dislocation Motion), Frank-Reid mechanism of dislocation multiplication, Strength of Alloy, Role of dislocation in crystal growth, Surface defects: Grain boundaries and stacking faults, Volume Defects.

Superconductivity: Meissner effect, Type-I and type-II superconductors; Heat capacity, energy gap and isotope effect, BCS theory, London equation, Flux quantization, Coherence, AC and DC Josephson effect, Superfluidity, High T_c superconductors and their applications (information only).

Transaction Mode:

Lecture delivery using White Board and PPT, Problem Solving through Assignments.

Suggested Readings:

1. J. Ziman, *Principles of the Theory of Solids* (Cambridge University Press, Cambridge, U.K.) 2011.
2. C. Kittel, *Introduction to Solid State Physics* (Wiley India (P) Ltd., New Delhi, India) 2007.
3. R.J. Singh, *Solid State Physics* (Pearson, New Delhi, India) 2011.
4. A.J. Dekker, *Solid State Physics* (Macmillan, London, U.K.) 2012.
5. N. W. Ashcroft and N. D. Mermin, *Solid State Physics* (Thomson Press), 2003.

Course Code: PHY.526**Course Title: Solid State Physics Laboratory****Total Hours: 120**

L	T	P	Cr
0	0	8	4

Learning Outcomes: The Solid State Physics laboratory experiments have been so designed that the students who have completed this course have a deep experimental understanding of basic concept of solid state physics learnt in the theory course.

Learning Outcomes: The Solid State Physics laboratory experiments have been so designed that the students learn basic concept of solid state physics learnt in the theory course. Student has to perform any of ten experiments from the following experiments.

1. Determination of carrier concentration and their sign in semiconductor at room temperature by Hall Effect.
2. Determination of dielectric constant of PZT material with Temperature variation and thus determining Curie temperature.
3. Electrons spin resonance.
4. Magnetic parameters of a magnetic material by hysteresis loop tracer.

5. To determine the magnetic susceptibility of NiSO₄, FeSO₄, CoSO₄ by Gauy's method.
6. To determine magneto resistance of a bismuth crystal as a function of magnetic field.
7. Determination of critical temperature of high temperature superconductor and Meissner effect for a high T_c superconductor.
8. Determination of ferromagnetic to paramagnetic phase transition temperature (T_c = Curie temperature).
9. Determination of dielectric constant of solids.
10. Study of the dispersion relation and cut-off frequency for the mono-atomic lattice. Study of the dispersion relation for the di-atomic lattice – ‘acoustical mode’ and ‘optical mode’ and energy gap.
11. Study of thermal expansion pf solids.
12. Study of thermal conductivity of solids.
13. Study of specific heat of solids.
14. Study of X-ray diffraction pattern of NaCl.

Transaction Mode:

Experimentation and Viva-voce.

Suggested Readings

1. J. Ziman, *Principles of the Theory of Solids* (Cambridge University Press, New Delhi) 2011.
2. J.P. Srivastava, *Elements of Solid State Physics* (PHI Learning, New Delhi, India) 2011.
3. R.J. Singh, *Solid State Physics* (Pearson, New Delhi, India) 2011.
4. C. Kittel, *Introduction to Solid State Physics* (Wiley India (P) Ltd., New Delhi, India) 2014.

Course Code: PHY.527

Course Tile: Introduction to Nanotechnology

Total Hours: 30

L	T	P	Cr
2	0	0	2

Learning outcomes: After a successful completion of the course, students will be able to explain nanomaterials based on their dimensionality, the importance of reduction in materials dimensionality, challenges and future of nanotechnology. Students will be able to demonstrate knowledge of various top-down and bottom-up synthesis approaches for nanomaterial fabrication. Students will also be able to give examples on the application of nanomaterials in various scientific areas such as engineering, physics, chemistry, biology, mathematics and computer science.

Unit I**7 hours**

Basics of Nanotechnology: Definition, Overview: Why and How, History of Nanotechnology, Types of nanomaterials (i.e. Zero (0), One (1), Two (2), and Three (3) dimensional), Graphene, Fullerenes, Single and Multi wall Carbon Nanotube, and Porous Silicon: Synthesis, Properties and Applications.

Unit II**8 hours**

Applications of Nanotechnology: Lotus, Rose Petal and Gecko effect, Applications of Nanotechnology in textile, paints that cleans air, Health Care, Cosmetics, Sports, Food, Water Purification, Use of nanosilver, Nano-Robotics, Defense, Agriculture, Construction and space, Use and Benefits of Nanotechnology, Challenges and Future of nanotechnology, Bio and Environmental Nanotechnology, Advantages and Disadvantages, Global ethics of nanotechnology. Devices by nanotechnology: Solar Cell, Fuel Cell, and LED.

Unit III**8 hours**

Synthesis of Nanomaterials: Fabrication methods i.e. top-down and bottom-up approach: Ball Milling, Sol-Gel method, Colloidal Method, Hydrothermal, Sonochemical, Biological Methods Using Plant Leaf and Microorganism, Micro-Emulsion Method, Core-shell particles.

Unit IV**7 hours**

Properties of Nanomaterials: Self Assembly, Structural, electrical, optical, mechanical, chemical, and magnetic properties at nanoscale.

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

1. An introduction to Nanoscience and Nanotechnology by Alain Nouailhat, Wiley (2006)
2. Introduction to Nanotechnology by Henrik Bruus, Springer (2004)
3. NANOTECHNOLOGIES: Principles, Applications, Implications and Hands-on Activities by Luisa Filippini and Duncan Sutherland, European Union, (2012) Luxembourg
4. Nanostructure and Nanomaterials (Synthesis, Properties and Applications) by Guozhong Cao, Imperial College Press (2004) London.
5. Nanotechnology and Nanoelectronics by W. R. Fahrner, Springer (2005) Berlin

SEMESTER-III

Course Code: PHY.551

Course Title: Statistical Mechanics

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: On the completion of this course, students will be able to explain the basics of thermodynamics and physical significance of various statistical quantities. They will be able to explain ensemble theory required to understand the macroscopic properties of the matter in bulk in terms of its microscopic constituents. They will also be able to define the Fermi-Dirac and Bose-Einstein distributions, state where they are applicable and understand how they differ from each other.

Unit-I

14 hours

Basics of Thermodynamics: Laws of thermodynamics and their consequences, Thermodynamic potentials and Maxwell relations.

Statistical Basis of Thermodynamics: Micro- and macro- states, Postulate of equal a priori probability, Contact between statistics and thermodynamics, Classical ideal gas, Entropy of mixing, Gibbs' paradox and its solution.

Unit-II

16 hours

Elements of Ensemble Theory: Phase space and Liouville's theorem, Microcanonical ensemble theory and its application to classical ideal gas and simple harmonic oscillator, System in contact with a heat reservoir, Thermodynamics of canonical ensemble, Partition function, Classical ideal gas in canonical ensemble, Energy fluctuation.

Grand Canonical Ensemble: System in contact with a particle reservoir, Chemical potential, Grand canonical partition function, Classical ideal gas in grand canonical ensemble theory, Density and energy fluctuations.

Unit-III

14 hours

Elements of Quantum Statistics: Quantum statistics of various ensembles, Ideal gas in various ensemble, statistics of occupation number, Thermodynamics of black body radiations.

Phase Transitions: Thermodynamic phase diagrams, Super-fluidity in liquid He II, First and second order phase transitions, Dynamic model of phase transition, Ising and Heisenberg model.

Unit-IV

16 hours

Ideal Bose and Fermi Gas: Thermodynamical behavior of ideal Bose gas, Bose-Einstein condensation, Gas of photons and phonons. Thermodynamical behavior of ideal Fermi gas, Heat capacity of ideal Fermi gas at finite temperature, Pauli paramagnetism, Landau diamagnetism, Ferromagnetism.

Thermodynamic Fluctuations: Diffusion equation, Random walk and Brownian motion, Introduction to nonequilibrium processes.

Transaction Mode:

Lecture, tutorial, problem solving

Suggested Readings:

1. R.K. Pathria and Paul D. Beale, *Statistical Mechanics* (Elsevier, USA) 2011.
2. K. Huang, *Statistical Mechanics* (Wiley India Pvt. Ltd., New Delhi, India) 1987.
3. R.H. Swendsen, *An Introduction to Statistical Mechanics and Thermodynamics* (Oxford University Press, Oxford, U.K.) 2012.
4. M.V. Sadovskii, *Statistical Physics* (Walter de Gruyter GmbH and Co. KG, Berlin/Boston, USA) 2012.
5. B.B. Laud, *Fundamentals of Statistical Mechanics* (New Age International, New Delhi) 2012.

Course Code: PHY.552**Course Title: Nuclear and Particle Physics****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: At the end of the course students will be able to explain basics of nuclear properties, nuclear interactions, nuclear decay, nuclear models, detectors, nuclear reactions and elementary particles.

Unit-I**15 hours**

Basic Nuclear Properties: Nuclear size, shape and charge distribution, Form factor, Mass and binding energy, Saturation of nuclear force, Abundance of nuclei, Spin, Isospin, Mirror nuclei, Parity and symmetry, Magnetic dipole moment and electric quadrupole moment. **Two Nucleon Problems:** Nature of nuclear forces, Deuteron problem, Spin dependence of nuclear forces, Form of nucleon-nucleon potentials, Electromagnetic moment and magnetic dipole moment of deuteron, General form of nuclear force. Experimental n-p scattering data, Partial wave analysis and phase shifts, Scattering length, Magnitude of scattering length and strength of scattering, Charge independence, Charge symmetry and iso-spin invariance of nuclear forces.

Unit-II**15 hours**

Nuclear Decay: Different kinds of particle emission from nuclei, Alpha decay Fine structure of α spectrum, Beta and Gamma decay and their selection rules. Fermi's theory of allowed beta decay, Selection rules for Fermi and Gamow-Teller transitions. Double beta decay.

Nuclear Models: Evidence of shell structure, Single particle shell model, its validity and limitations, Rotational spectra, Shell model, Liquid drop model, Collective model, Semi empirical mass formula. Exchange force model. Double beta decay.

Unit-III**15 hours**

Nuclear Reactions: Types of Nuclear Reactions and conservation laws, Energetic of Nuclear reactions, Isospin, Reaction Cross sections, Coulomb Scattering, Optical model, Compound nucleus reactions, Direct Reactions, Resonance reactions, Heavy Ion reactions,

Neutron Physics: Neutron Sources, absorption and moderation of neutrons, Introduction to nuclear fission and fusion.

Unit-IV**15 hours**

Elementary Particle Physics: Classification of particles: Fermions and bosons, Elementary Particles and antiparticles, Quarks model, baryons, mesons and leptons, Classification of fundamental forces: Strong, Electromagnetic, Weak and Gravitational. Conservation laws of momentum, energy, Angular momentum, Parity non conservation in weak interaction, Pion parity, Isospin, Charge conjugation, Time reversal invariance, CPT invariance. Baryon and Lepton numbers, Strangeness, charm and other additive quantum numbers, Gell Mann Nishijima formula.

Transaction Mode:

Lecture, tutorial, problem solving

Course Code: PHY.553
Course Title: Nuclear Physics Laboratory
Total Hours: 120

L	T	P	Cr
0	0	8	4

Learning Outcomes: At the end of the course the students will be able to perform and explain the various experiments related with G.M counter and gamma ray spectrometer.

Course Contents

Student has to perform ten experiments out of the following list of experiments.

1. Study of the characteristics of a GM tube and determination of its operating voltage, plateau length / slope etc.
2. Verification of inverse square law for gamma rays.
3. Study of nuclear counting statistics.
4. Estimation of efficiency of the G.M. detector for beta and gamma sources.
5. To study beta particle, range and maximum energy (Feather Analysis).
6. Backscattering of beta particles.
7. Production and attenuation of bremsstrahlung.
8. Measurement of short half-life
9. Demonstration of nucleonic level gauge principle using G.M counting system and detector.
10. Beam interruption detection system to check packs for content level, or counting of individual items.
11. Scintillation detector: energy calibration, resolution and determination of gamma ray energy.
12. Alpha spectroscopy using surface barrier detectors.
13. Study of energy resolution characteristics of a scintillation spectrometer as a function of applied high voltage and to determine the best operating voltage
14. Measurement of resolution for a given scintillation detector using Cs-137 source.
15. Finding the resolution of detector in terms of energy of Co-60 system.
16. Energy calibration of gamma ray spectrometer (Study of linearity).
17. Spectrum analysis of Cs-137 and Co-60 and to explain some of the features of Compton edge and backscatter peak.
18. Unknown energy of a radioactive isotope.
19. Variation of energy resolution with gamma energy.
20. Activity of a gamma source (Relative and absolute methods).
21. Measurement of half value thickness and evaluation of mass absorption coefficient.
22. Back scattering of gamma Rays.

Transaction Mode:

Demonstration, experimentation

Suggested Readings:

5. H. Nikjoo, S. Uehara, D. Emfietzoglou, *Interaction of Radiation with Matter* (CRC Press, London, U.K.) 2012.

Course Code: PHY.554**Course Title: Advanced Solid State Physics****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: The purpose of this course is to introduce students to the fundamental and advanced concepts of solid state physics. After the completion of this course the students will have solid understandings of the topics include Fermi surfaces and its determinations, band gap in semiconductor, Plasmons, Dielectric, Ferroelectrics and optical processes in crystalline and amorphous solids.

Unit-I**15 hours**

Fermi Surfaces and Metals: Zone schemes, Construction of Fermi surfaces, Electron orbits, Hole orbits and open orbits, Calculation of energy bands: Wigner-seitz Method, Pseudopotential Method, Experimental methods in Fermi surface studies: De Haas-van Alphen Effect, Fermi Surface of Cu and Au, Magnetic Breakdown.

Unit-II**15 hours**

Semiconductor Crystals: Direct and indirect band gap, Equation of motion, Intrinsic and extrinsic semiconductors, Physical interpretation of effective mass, Effective masses in semiconductors, Cyclotron resonance, Intrinsic carrier concentration, Fermi level and electrical conductivity, Metal-metal contacts, Thermoelectric effects: Diode and transistors.

Unit-III**15 hours**

Dielectrics and Ferroelectrics: Local field, Clausius-Mossotti relation, Components of polarizability: Electronic, Ionic, Orientational, Measurements of dielectric constant, Pyroelectric and ferroelectric crystals and classification, Electrostatic screening, Plasma oscillations, Transverse optical modes in plasma, Interaction of EM waves with optical modes: Polaritons, LST relation, Electron-electron interaction, Electron-phonon interactions: Polarons.

Unit-IV**15 hours**

Plasmons and Optical Processes: Connection between optical and dielectric constants, Optical reflectance, Optical properties of metals, Luminescence, Types of luminescent systems, Electroluminescence, Color centers, Production and properties, Types of color centers, Excitons (Frenkel, Mott-Wannier), Experimental studies (alkali halide and molecular crystals), Raman effect in crystals, Diffraction pattern and low energy excitations in amorphous solids

Transaction Mode:

Lecture delivery using White Board and PPT, Problem Solving through Assignments.

Suggested Readings:

1. J. Ziman, *Principles of the Theory of Solids* (Cambridge University Press, Cambridge, U.K.) 2011.
2. C. Kittel, *Introduction to Solid State Physics* (Wiley India (P) Ltd., New Delhi, India) 2007.

4. A.J. Dekker, *Solid State Physics* (Macmillan, London, U.K.) 2012.
5. N. W. Ashcroft and N. D. Mermin, *Solid State Physics* (Thomson Press), 2003.

Course Code: PHY.555**Course Title: Nuclear Techniques****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: This course will introduce the students with different techniques used to study nuclear physics, starting from design of different radiation source, detection, interaction and its applications.

Unit: 1**15 hours**

Accelerators: Motion of charged particles in electric and magnetic fields, Axial and radial magnetic field distributions in dipole, quadrupole and hexapole arrangement, Equipotential lines in different electrodes arrangement, Particle trajectory in electric and magnetic field, Electron sources, ion sources, Van de Graaf generator, DC linear accelerator, RF linear accelerator, Cyclotron, Microtone, introduction to advance accelerator (LHC)

Unit: II**15 hours**

Detectors: Relation detectors Gaseous ionization, ionization and transport phenomena in gases, proportional counters, organic and inorganic scintillators, detection efficiency for various types of radiation, photomultiplier gain, semiconductor detectors, surface barrier detector, Si(Li), Gel(Li) and HPGe detectors.

Interaction of radiation with matter: General description of interaction processes, photoelectric effect, Compton Effect, pair production, interactions of directly ionizing radiation, stopping power, linear energy transfer, range of particles, interaction of indirectly ionizing radiation attenuation coefficient.

Unit: III **15 hours**

Reactors and artificial radioisotopes: Neutron sources, neutron detectors, measurement of cross-sections for nuclear reaction, thermal and fast reactors, Q values, Fission, Fusion, production of radioisotopes, Reactor operation, thermal neutrons, neutron scattering and applications.

Unit: IV **15 hours**

Analysis Nuclear reaction: Elemental analysis by neutron activation analysis, proton induced X-ray emission, Rutherford backscattering, Resonance nuclear reaction, Elastic RDA, ion scattering and Neutron Depth Profile.

Suggested Readings:

1. Nuclear radiation detectors, S. S. Kappor and V. S. Rmanurthy. (Wiley Eastern Limited, New Delhi,) 1986.
2. Introduction to radiation protection dosimetry, J. Sabol and P. S. Weng, (World Scientific), 1995.
3. Techniques for nuclear and particle physics, W. R. Len (Springer), 1955.
4. Nuclear radiation detection, W. J. Price, (McGraw-Hill, New York), 1964.
5. Alphas, beta and gamma-ray spectroscopy, K. Siegbahn, (North Holland, Amsterdam), 1965.
6. Introduction to experimental nuclear physics, R. M. Singru, (John Wiley and Sons), 1974.

Transaction Mode:

Lecture, demonstration, PPT

Course Code: PHY.556

Course Title: Introduction to Computational Materials Physics

Total Hours: 30

L	T	P	Cr
2	0	0	2

Learning Outcomes: At the end of this course, students will be able to outline nuts and bolts of physics required to compute the properties of materials using modern computational methods. They will also be able to apply the laws of quantum physics and the concepts of solid state physics to compute the properties of materials. Students will also able to explain the details of density functional theory for electronic structure problems, pseudopotential approach, plane waves and localized orbitals basis sets methods.

Unit-I**8 hours**

Elementary Density Functional Theory (DFT): Electron density in DFT, Hohenberg-Kohn theorems, Kohn Sham approach, Exchange-correlation functionals: local density approximation and generalized gradient approximation, Solving Kohn-Sham equations, Extension and limitations of DFT.

Unit-II**7 hours**

Treatment of Solids: Pseudopotential approach, Types of pseudopotentials, Reducing the calculation size: supercell approach, irreducible Brillouin zone, k-point sampling, Periodic boundary conditions and slab model; Some practical topics: energy cutoff and smearing; Electronic and Ionic minimization, Crystal structure prediction, Phase transformations, Surface relaxation, Surface reconstruction.

Unit III**8 hours**

Electronic Structure of Solids: Origin of energy gap, Wave equation of electron in periodic potential, Empty lattice approximation, Electronic structure of metals and semiconductors, Optical processes: Kramers-Kronig relations, electronic interband transitions, Dielectric functions and absorption spectra, Excitons, Energy loss of fast particles in a solid.

Unit IV**7 hours**

Electronic Structure Methods: Bloch theorem: Fourier expansion and Fast Fourier transformation, Matrix expression for Kohn-Sham equations, Tight binding method, Determination of electronic structure: plane waves and localized orbitals methods.

Transaction Mode:

Lecture, demonstration, tutorials, power point presentations.

Suggested Readings:

1. June Gunn Lee, *Computational Materials Science: An Introduction*, (CRC Press 2011)
2. Efthimios Kaxiras, *Atomic and Electronic Structure of Solids* (Cambridge Unive. Press) 2007.
3. Richard M. Martin, *Electronic Structure: Basic Theory and Practical Methods*(Cambridge University Press) 2008.

5. Feliciano Giustino, *Materials Modelling Using Density Functional Theory: Properties and Predictions*, Wiley (2009).
6. Rajendra Prasad, *Electronic Structure of Materials*, Taylor and Francis (2013).

Course Code: PHY.558

Course Title: Computational Materials Physics Laboratory

Total Hours: 60

L	T	P	Cr
0	0	4	2

Learning Outcomes: At the end of this laboratory course, students will be able to model and simulate the properties of materials using first principles method and computer as a tool.

List of Practical's

1. Plot Total Energy Vs k-points for different Bulk materials to test the convergence of your result.
2. To find the optimized geometry of Bulk materials such Fe, Au, Co, NaCl and etc.
3. Compute and analyze the electronic structure of semiconductors such as Si and Ge.
4. Compute and analyze the electronic structure of metals such as Au and Pt.
5. Electronic structure of graphene using density functional calculations.
6. Electronic structure of 1D lattice such as Carbon nanotube
7. Determine the magnetic ground state of different magnetic systems.

Transaction Mode:

Demonstration, experimentation and group learning.

Suggested Readings:

1. June Gunn Lee, *Computational Materials Science: An Introduction*, (CRC Press 2011)
2. Efthimios Kaxiras, *Atomic and Electronic Structure of Solids* (Cambridge Unive. Press) 2007.
3. Richard M. Martin, *Electronic Structure: Basic Theory and Practical Methods*(Cambridge University Press) 2008.

5. Feliciano Giustino, *Materials Modelling Using Density Functional Theory: Properties and Predictions*, Wiley (2009).
6. Rajendra Prasad, *Electronic Structure of Materials*, Taylor and Francis (2013).

Course Code: PHY.557

Course Title: Functional Materials and Devices

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: Physicists and Chemists are now playing an important role in the growing field of materials research. The aim of this course is to introduce students to this area of modern materials. The students after the

completion of this course will have solid understanding of the fundamental principles of various advanced functional materials and Devices.

Unit-I

15 hours

Advanced Ceramic and Smart Materials: Ceramic Materials: Classification, Preparation and Properties, Composites, Smart Materials exhibiting: Ferroelectric, Dielectrics, Piezoelectric, Thermoelectric, Luminescence, Photocromics, Thermocromics and Electrochromic Materials, Phase Change Material, Shape Memory Alloys, Smart Structure and Robotics.

Unit-II

15 hours

Magnetic and Multiferroics Materials: Ferrites, Giant magnetoresistance (GMR), Magnetic materials for recording and computers., Spin Polarization, Colossal Magnetoresistance (CMR), La and Bi-based Perovskite, Spin-Glass, Spintronics: Magnetic tunnel junction, Spin transfer torque, Applications, Multiferroics: Types and Mechanism, BiFeO₃ and BaTiO₃ Multiferroics.

Unit-III

15 hours

Polymers and Composites: Basic Concepts on Polymers, Polymers (Insulating, electronic and functionalized), Polymer Configuration (Tacticity), Polymer Conformation (Trans, Staggered, Gauche, Eclipsed), Polymer processing: Hot molding, Film blowing, Melt spinning etc Composites: Varieties, Role of Matrix Materials, Mixing Rules, Polymer composites and nanocomposites (PNCs), PNCs for Li-ion battery, Supercapacitor, fuel cell, LED's and solar cell, synthesis and engineering of PNCs.

Unit-IV

15 hours

Devices: Photovoltaic, Solar Energy, Nanogenerators, LED, Electrochromic displays (n & p-type materials, electrolytes, device fabrication and property measurements), Resistive switching, Supercapacitor and Li-ion batteries (Types and Properties: Crystallinity, Free ions and ion pair's contribution, Ionic radii of migrating species, Ionic Conductivity, Transport parameters, Transference Number, Thermal Stability, Porosity and Electrolyte Uptake/Leakage, Thermal Shrinkage, Glass transition temperature, Electrochemical Stability, Mechanical Stability) Advantages and Disadvantages, Ragone plot, Nyquist plot, Charging-discharging.

Fuel Cell (Alkaline Fuel Cell, Polymer Electrolyte Membrane Fuel Cell, Direct Methanol Fuel Cell, Solid Oxide Fuel Cell).

Transaction Mode:

Lecture, PPT.

Suggested Readings:

Course Code: PCP.543
Course Title: Seminar-I
Total Hours: 30

L	T	P	Cr
0	0	2	1

Learning Outcomes: At the end of this course, students will be well versed with the communication and presentations skills required at different academic and research forum. Students would be able to make presentation on the Physical concepts and research related topics.

Course Code: PCP.561
Course Title: Fundamentals of Molecular Simulations

L	T	P	Cr
4	0	0	4

Course Objective and Learning outcomes: The objective of this subject is to ensure that a student learns modelling of molecular structures and understanding the dynamics of the structural transitions, which will help them use the techniques of molecular simulations in their further potential careers in academia and industry.

Unit I

Molecular Modeling and Structure - molecular modeling today: overview of problems, tools, and solution analysis, minitutorials with protein and nucleic acid structure as example.

Force Fields and Molecular Representation – (a) Intramolecular Interactions, (b) Non-bonded Interactions – London (van der Waals) Interactions, Electrostatic Interactions, (c) Hydrogen Bonds, (d) Constraints and Restraints, (e) United Atom and Other Coarse-Grained Approaches, (f) Non-pairwise Interactions, (g) How accurate are force fields?

Example: Protein, Nucleic Acid, Small Molecule Force Field, Water Models.

Unit II

Methods for Simulating Large Systems

(a) Non-bonded Cutoffs – Shifted Potential and Shifted Force, Switching Functions, Neighbor Lists, (b) Boundaries – Periodic Boundary Conditions, Stochastic Forces at Spherical Boundary, (c) Long-range Interactions – The Ewald Sum, The Reaction Field Method

Unit-III

Energy Minimization and Related Analysis Techniques

(a) Steepest Descent, (b) Conjugate Gradient, (c) Newton-Raphson, (d) Comparison of Methods, (e) Advanced Techniques: Simulated Annealing, Branch-and-bound, Simplex, (f) What's the big deal about the minimum?

Introduction to Equilibrium Statistical Mechanics

(a) Phase space, Ergodicity, and Liouville's theorem, (b) Ensemble theory, Thermodynamic averages - Microcanonical Ensemble, Canonical Ensemble, Other MD Simulation Related Ensembles (c) Statistical Mechanics of Fluids

Unit-IV

Simulation Methods:

Monte Carlo: (a) MC integration and Markov chains, (b) The Metropolis method, (c) Biased MC

Molecular Dynamics: (a) Classical Mechanics: Equations of Motion, (b) Finite Difference Methods: Verlet Algorithm, Velocity Verlet, The Time Step: Practical Issues, Multiple time-step algorithms (c) Constraint Dynamics: Fundamental concepts, SHAKE and RATTLE, (d) Temperature: Maxwell-Boltzmann distribution of velocities, (e) Temperature Control: Velocity Scaling, Andersen's Method, Nose-Hoover Dynamics, (f) Pressure Control: Andersen's Method, Nose-Hoover Method, Rahman-Perrinilo Method, (g) Calculating properties from MD trajectories, (h) Hybrid MC,

Free Energy: (a) Perturbation Methods, (b) TI (Thermodynamic Integration) Brownian dynamics and the Langevin Equation.

Suggested Readings:

1. Computer Simulation of Liquids, by M.P. Allen and D.J. Tildesley, (QC 145.2.A43 1992)
2. Understanding molecular simulation, by Daan Frenkel and Berend Smit, (QD 461 .F86 1996)
3. Andrew R. Leach Molecular Modelling Principles and applications . (2001) II ed . Prentice Hall.

Transaction Mode:

Power Point Presentation .

Course Code: PCP.599**Course Title: Project Work-I**

L	T	P	Cr
0	0	12	6

Learning Outcomes: At the end of Project work-I students will be able to review the literature on a specific research problem. They will be able to define the objectives and motivations of research problem to be carried out. Students will also be able to explain the nuts and bolts of the theoretical concepts of the problem (experimental or theoretical) to be carried out.

Transaction Mode:

Power point presentation, report writing.

Course Code: XXX**Course Title: XXX****Total Hours: 15**

L	T	P	Cr
1	-	-	1

Learning Outcomes: This course is introducing to enhance the value education among the students. Students have to choose one of the course from the pool of courses designed at university level.

SEMESTER IV**Course Code: PHY.571****Course Title: Research Methodology****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: The course Research Methodology will introduce the students of M. Sc. Physics to basic concepts of research methods. The students will learn about the preparation of research plan, reading and understanding of scientific papers, scientific writing, research proposal writing, ethics, plagiarism, laboratory safety issues and intellectual property rights etc.

Unit-I**15 hours**

General principles of research: Meaning and importance of research, Different types and styles of research, Role of serendipity, Critical thinking, Creativity and innovation, Formulating hypothesis and development of research plan, Review of literature, Interpretation of results and discussion.

Bibliographic index and research quality parameters- citation index, impact factor, *h* index, *i10* index, etc. Research engines such as google scholar, Scopus, web of science, Scifinder etc.

Unit-II**15 hours**

Technical & scientific writing- theses, technical papers, reviews, electronic communication, research papers, etc., Poster preparation and presentation, and Dissertation. Making R and D proposals, Reference management using various softwares such as Endnote, reference manager, Refworks, etc. Communication skills—defining communication; type of communication; techniques of communication, etc.

Data Analysis: Graph plot, Error analysis, Curve fitting: linear and nonlinear.

Unit-III**15 hours**

Library: Classification systems, e-Library, Reference management, Web-based literature search engines.

Laboratory Safety Issues: Lab, Workshop, Electrical, Health and fire safety, Safe disposal of hazardous materials, Radiation safety.

Entrepreneurship and Business Development: Importance of entrepreneurship and its relevance in career growth, Types of enterprises and ownership.

Unit-IV**15 hours**

Plagiarism: Plagiarism, definition, Search engines, regulations, policies and documents/thesis/manuscripts checking through softwares, Knowing and Avoiding Plagiarism during documents/thesis/manuscripts/ scientific writing.

Intellectual Property Rights: Intellectual Property, intellectual property protection (IPP) and intellectual property rights (IPR), WTO (World Trade Organization), WIPO (World Intellectual Property Organization), GATT (General Agreement on Tariff and Trade), TRIPs (Trade Related Intellectual Property Rights), TRIMS (Trade Related Investment Measures) and GATS (General Agreement on Trades in Services), Nuts and Bolts of Patenting, Technology Development/Transfer Commercialization Related Aspects, Ethics and Values in IP.

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

1. S. Gupta, *Research Methodology and Statistical techniques* (Deep and Deep Publications (P) Ltd. New Delhi, India) 2005.
2. R. Kothari, *Research Methodology* (New Age International, New Delhi, India) 2008.
3. **Web resources:** www.sciencedirect.com for journal references, www.aip.org and www.aps.org for reference styles.
4. **Web resources:** www.nature.com, www.sciencemag.org, www.springer.com, www.pnas.org, www.tandf.co.uk, www.opticsinfobase.org for research updates.

Course Code: PHY.572

Course Title: The Enrich Physics Course-I

Total Hours: 30

L	T	P	Cr
2	0	0	2

Learning Outcomes: After a successful completion of the course, students will be able to demonstrate the knowledge of various mathematical formulations and their use to solve physics problems. They will also be able to explain various aspects and application of classical and quantum physics.

Unit-I:

8 hours

Vector calculus, matrices, differential equations, Fourier series, analytic functions, poles, residues and evaluation of integrals.

Unit-II:

7 hours

Lagrangian and Hamiltonian formalism, Central force motions, Conservation laws and, cyclic coordinates, Rigid body dynamics, small oscillations.

Unit-III:

8 hours

Applications of Schrodinger's equation, Angular momentum, Scattering theory and relativistic quantum theory, perturbation theories, Atomic and Molecular Spectra.

Unit-IV:

7 hours

Laws of thermodynamics, Ensemble theory, Phase transition, Bose gas, Fermi gas.

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

1. G. Arfken, H. Weber and F. Harris, *Mathematical Methods for Physicists* (Elsevier Academic Press, Massachusetts, USA) 2012.
2. P.S. Joag and N.C. Rana, *Classical Mechanics* (Tata McGraw-Hill, Noida, India) 1991.
3. N.Zettili, *Quantum Mechanics-Concepts and Applications* (John Wiley & Sons Ltd., Sussex, U.K.) 2009.
4. D. J. Griffiths, *Introduction to Quantum Mechanics*, 2nd Ed. (Pearson Education, India) 2015.
5. Fundamentals of Molecular Spectroscopy, C. N. Banwell and E. M. McCash, (Tata, McGraw Hill Publishing Company Limited).
6. R.K. Pathria and Paul D. Beale, *Statistical Mechanics* (Elsevier, USA) 2011.

Course Code: PCP.572

Course Title: Molecular Simulation Lab

L	T	P	Cr
0	0	4	2

Course Objective and Learning outcomes: The objective of this subject is to ensure that a student gains practical in-hand experience of various modeling and classical simulation tools, including, but not limited to those that are used in macromolecular modeling. The course will help the students learn the use of the techniques of molecular simulations, which will enhance their employability in their further potential careers in academia and industry.

1. Linux basics and remote computing
2. Coordinate generations and inter-conversions of small molecules
3. Energy minimizations and optimization, ab initio methods
4. Advanced Visualization Software and 3D representations with VMD
5. Introduction to PDB Data
6. Secondary Structure Prediction, Fold Recognition
6. Molecular Dynamics with GROMACS
 - a. Water liquid structure and dynamics
 - b. Simulation of Ionic Solutions
 - c. Simulation of Protein in Water
 - d. Simulation of Membrane Proteins
 - e. Simulations of DNA
7. Review of Molecular Dynamics Principles

Suggested Readings:

1. Andrew R. Leach Molecular Modelling Principles and applications. (2001) II ed . Prentice Hall. LTPCr0042
2. Fenniri, H. "Combinatorial Chemistry –A practical approach", (2000) Oxford University Press, UK.
3. Lednicer, D. "Strategies for Organic Drug Discovery Synthesis and Design"; (1998) Wiley International Publishers. Gordon, E.M. and Kerwin, J.F "Combinatorial chemistry and molecular diversity in drug discovery" (1998) Wiley-Liss Publishers.

Course Code: PHY.573

Course Title: The Enrich Physics Course-II

Total Hours: 30

L	T	P	Cr
2	0	0	2

Learning Outcomes: After a successful completion of the course, students will be able to demonstrate the knowledge of electrostatics & magnetostatics including Maxwell's equations. They will also be able to explain various aspects of solid state physics such as band theory of solids, diffraction and the structure factor. Along with this, they will also be able to demonstrate the knowledge of accelerators and detectors.

Unit-I: **8 hours**
Electrostatics & magnetostatics, Maxwell's equations, electromagnetic waves, wave guides, radiation.

Unit-II: **7 hours**
Two Nucleon Problems, Nuclear Decay, Nuclear models, Detectors, Accelerators, Nuclear Reactions.

Unit-III: **8 hours**
Network Theorems, Semiconductor, transistors, OpAmp, binary and sequential logic.

Unit-IV: **7 hours**
Diffraction and the structure factor, specific heat, Hall effect, band theory of solids, Superconductivity.

Transaction Mode:
Lecture, demonstration, PPT

Suggested Readings:

1. D.J. Griffiths, *Introduction to Electrodynamics*, Prentice Hall of India Pvt.Ltd., New Delhi,2012.
2. B. Martin, *Nuclear & Particle Physics An Introduction* : (John Wiley & Sons, Inc., New Jersey, USA) 2011.
3. J. Millman, C. Halkias and C. Parikh, *Integrated Electronics : Analog and Digital Circuits and Systems* (Tata McGraw - Hill Education, Noida, India) 2009.
4. C. Kittel, *Introduction to Solid State Physics* (Wiley India (P) Ltd., New Delhi, India) 2007.

Course Code: PHY.574

Course Title: Introduction to Mesoscopic Physics

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: After a successful completion of the course, students will be able to explain the transition regime between macroscopic and microscopic object. They will be able to demonstrate the knowledge for quantum transport with illustrative examples showing how conductors evolve from the atomic to the ohmic regime as they get larger. In this regard, they will be able to explain various phenomenon such as, quantization of electrical conductance in nanoscale conductors, Coulomb Blockade, quantum capacitance and etc.

Unit I **15 hours**
Introduction, Why Electrons Flow, Conductance Formula, Ballistic Conductance, Diffusive Conductance, Connecting Ballistic to Diffusive, Dispersion Relation, Drude Formula.

Unit II**15 hours**

Counting States, Density of States, Number of Modes, Electron Density, Conductivity vs. Electron Density, Quantum Capacitance, What and Where is the Voltage, A New Boundary Condition, Current from Quasi-Fermi Levels, Electrostatic Potential.

Unit III**15 hours**

Boltzmann Equation, Semiclassical Model, Quantum Model, Landauer Formulas, NEGF Equations, Self-Energy, Surface Green's Function, Current Operator, Scattering Theory, Transmission, Golden Rule, Quantum Master Equations.

Unit IV**15 hours**

Electronic Spin-Orbit Coupling, Spin Hamiltonian, Spin Density/Current, Spin Voltage, Spin Circuits, Seebeck Coefficient, heat Current, One-level Device, Second Law, Entropy.

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

1. Quantum Transport Atom to Transistor by Supriyo Datta (CAMBRIDGE)
2. Lessons from Nanoelectronics: A New Perspective on Transport: Volume 1 & 2 by Supriyo Datta (World Scientific)
3. Theory of Quantum Transport at Nanoscale: An Introduction by Dmitry A Ryndyk (Springer)
4. Quantum Transport: Introduction to Nanoscience by Yuli V. Nazarov and Yaroslav M. Blanter (CAMBRIDGE)

Course Code: PHY.578**Course Title: Particle Physics****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: After a successful completion of the course, students will be able to explain the basic properties of elementary particles, various fundamental interactions (Strong, weak and electromagnetic and gravity), kinematics of decay and scattering, symmetries, and various aspects of quark models.

Unit-I**15 hours**

Particles and Forces: Production and basic properties of elementary particles in cosmic rays and accelerators experiments, mass spectra and decays of elementary particles, Fundamental interactions: basic properties of Strong, weak and electromagnetic and gravity. Yukawa theory of pion exchange.

Unit-II**15 hours**

Kinematics: Kinematics of decay and scattering, Scattering in lab and centre of mass frames, Two and Three body decay phase space, Dalitz plot.

Symmetries and Conservation Laws: Space- time symmetries, Invariance Principles, Parity, Intrinsic parity, Parity constraints on the S- Matrix for Hadronic Reactions, Time – Reversal Invariance, conservation of Quantum Numbers, Isospin, Charge Conjugation, G- parity, CP and CPT Invariance (statement and consequences only).

Unit-III**15 hours**

Internal symmetries:, Isospin, strangeness, charm quantum numbers, unitary groups, Isospin and SU (2), SU(3), Octet and decuplet irreducible representations of SU(3), SU(3) classification of mesons and baryons, Applications of Flavor SU(3), Gell- Mann Okubo Mass Formula, omega-phi mixing, Isospin relations for Pion-nucleon strong interaction.

Quark Model:- Quark structure of strange and nonstrange hadrons, need of colour quantum number. observation of new flavour states, charm, bottom hadrons, higher symmetries (brief description). Application of quark model for electromagnetic decays of vector mesons.

Unit-IV**15 hours**

Weak Interactions: Classification of weak Interactions; Leptonic Semi-Leptonic and Non- Leptonic Decay, Tau- Theta Puzzle, Parity Violation in Weak Decays Selection Rules Semileptonic Decays, and nonleptonic decays, Universality of Weak Interactions, Fermi Theory of weak interactions, Intermediate Vector – Boson Hypothesis, Helicity of Neutrino, Two Component Theory of Neutrino, K⁰-K⁰bar Mixing and CP Violation

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

10. W.E. Burcham and M. Jobes, Nuclear Physics, (Indian edition) Addison Wesley. Pub.

Course Code: PHY.576

Course Title: Nanostructured Materials

Total Hours: 60

L	T	P	Cr
4	0	0	4

Learning Outcomes: After the completion of this course student will have solid understandings of nanomaterials, their properties, synthesis via different methods, applications of nanomaterials and different characterization tools that are used to probe the nanomaterials.

Unit I

15 hours

Nanomaterials, Their Properties and Applications: Low-dimensional materials: Quantum dot, tube and well, Some special nanomaterials: Synthesis, properties and applications of Fullerenes, Carbon Nanotubes (SWCNT and MWCNT) and Nanowires, Graphene, Porous materials: Porous silicon, Aerogel, Quantum size effect, Self assembly of Nanomaterials, Structural, Electrical, optical, mechanical, chemical, and magnetic properties at nanoscale, Applications and benefits of nanotechnology, Nanotechnology Ethics and Environment, Challenges and Future of nanotechnology.

Unit II

15 hours

Synthesis of Nanomaterials: Fabrication methods i.e. top-down and bottom-up approach, Synthesis of nanomaterials by Physical, Chemical and Biological methods, Thin Film nanomaterials, Electrolytic deposition, Thermal evaporation, Spray pyrolysis, Sputtering, Pulse laser deposition, LB, Spin coating, Dip coating, Solution cast, Tape casting, Sol gel, Chemical vapour deposition, Molecular beam epitaxy, Cluster beam evaporation, Ion beam deposition, Chemical bath deposition with capping techniques.

Unit III

15 hours

Microscopy: Light Microscopy (Bright field, dark field, phase contrast), Fluorescence (wide-field, confocal, 2-photon) microscopy, Field Emission Scanning Electron Microscopy (FESEM), Energy-dispersive X-ray spectroscopy (EDS), Transmission Electron Microscopy (TEM), High resolution TEM, Selected area electron diffraction (SAED).

Surface Probe Analysis: Atomic Force Microscope (AFM), Scanning Tunnelling Microscope (STM), spectroscopy, X-ray photoemission spectroscopy (XPS).

UNIT-IV

15 hours

Diffraction Methods: Generation and detection of X-rays, Diffraction of X-rays, X-ray diffraction techniques, Electron diffraction.

Spectroscopy: IR Spectroscopy, FTIR, UV-Visible spectroscopy, Raman Spectroscopy, Auger Spectroscopy, Impedance Spectroscopy, Dielectric Spectroscopy.

Transaction Mode:

Lecture delivery using White Board and PPT, Problem Solving through Assignments.

Suggested Readings:

1. Functional Metal Oxides: New Science and Novel Applications by S. B. Ogale, T. V. Venkatesan, and M. G. Blamire, Wiley-VCH (2013)
2. Physical Metallurgy, Vol. 1 and Vol. 2 by R. W. Chan and P. Hassen North Holland Publishing Company, New York, (1983).
3. Modern Physical Metallurgy and Materials Engineering 6th Edition by R. E. Smallman, Butterworth-Heinemann, (1999)
4. Atomic Force Microscopy: Understanding Basic Modes and Advanced Applications by Greg Haugstad (John Wiley & Sons, 2012).
5. Textbook of Nanoscience and Nanotechnology by B.S Murty, P.Shankar, B. Raj, B. B. Rath, and J. Murday (Springer, 2013).
6. Handbook of Nanophysics by Klaus D. Sattler (CRC press, 2010).
7. Nanostructured Materials and Nanotechnology by Claudia Gutierrez-Wing, Jos Luis Rodriguez-Lpez, Olivia A. Graeve, and Milton Muoz-Navia (Cambridge University Press, 2013).

Course Code: PHY.577**Course Title: Materials Characterizations****Total Hours: 60**

L	T	P	Cr
4	0	0	4

Learning Outcomes: At the end of the course, students would be able to know the basic characterizations used for the different information and purpose of the prepared nanomaterials/thin films.

Unit I**15 hours**

Microscopy: Optical Microscopy, Scanning Electron Microscopy (SEM), Field Emission Scanning Electron Microscopy (FESEM), Energy-dispersive X-ray spectroscopy (EDS), Transmission Electron Microscopy (TEM), High resolution TEM, Selected area electron diffraction (SAED).

Diffraction Methods: Generation and detection of X-rays, Diffraction of X-rays, X-ray diffraction techniques, Electron diffraction.

Unit II**15 hours**

Surface Probe Analysis: Atomic Force Microscope (AFM), Scanning Tunneling Microscope (STM), X-ray photoemission spectroscopy (XPS), Angle Resolved XPS (ARPS), Rutherford Back Scattering, Carbon Dating, Ion Beam (Low energy and high energy) irradiation.

UNIT III**15 hours**

Spectroscopy: IR Spectroscopy, FTIR, UV-Visible spectroscopy, Raman Spectroscopy, Auger Spectroscopy, Impedance Spectroscopy (Nyquist Plot, Bode Plot, Electrical { electronic, ionic, cationic} conductivity estimation, ac

conductivity and Jonscher Power law), Dielectric Spectroscopy (Cole-Cole Plot, Cole-Davidson plot, Debye Plot, loss tangent, sigma representation, relaxation time), Modulus spectroscopy.

Unit IV

15 hours

Thermal Analysis: Thermogravimetric analysis, Differential thermal analysis, Differential Scanning calorimetry, Modulated DSC, Dynamic Thermal Analysis, Universal tensile testing.

Transport Number Analysis: Transference Number (Electron, ion, cation transport measurement) Analysis, IV characteristics, Activation Energy Estimation (VTF and Arrhenius), Transport Parameters analysis.

Transaction Mode:

Lecture, demonstration, PPT

Suggested Readings:

1. Materials Characterization: Introduction to Microscopic and Spectroscopic Methods, 2nd Edition, by Yang Leng, WILEY (2013).
2. Atomic Force Microscopy: Understanding Basic Modes and Advanced Applications, by Greg Haugstad, WILEY (2012)
3. Introduction to Scanning Tunneling Microscopy, by C. Julian Chen, Oxford Unive. Press (1993)
4. An Introduction to Surface Analysis by XPS and AES, by John F. Watts, and John Wolstenholme, WILEY (2003)

Course Code: PCP.544

Course Title: Seminar-II

Total Hours: 30

L	T	P	Cr
0	0	2	1

Learning Outcomes: At the end of this course, students will be able to improve their communication and presentations skills by presenting topics related to their research project.

Transaction Mode:

Power point presentation.

Course Code: PCP.599

Course Title: Project Work-II

L	T	P	Cr
0	0	12	6

Learning Outcomes: At the end of Project work-II students will be able explain to perform theoretical/experimental results through presentation and project report. They will also be able to describe the possible application of their research.

Transaction Mode:

Power point presentation, report writing.

Course Code: XXX
